Final stages of cloud evolution involve cloud disruption by stellar feedback

Final stages of cloud evolution involve cloud disruption by stellar feedback

→ **Importance of pre-supernovae feedback ?**

Final stages of cloud evolution involve cloud disruption by stellar feedback

→ **Importance of pre-supernovae feedback ?**

→ Statistical study of a large sample of HII regions and GMCs

HII regions:

- Nebulae catalogue from PHANGS-MUSE survey
- **32 000** HII regions
- Observed in H α
- 19 nearby galaxies

Santoro et al. (2022)

Emsellem et al. (2022)

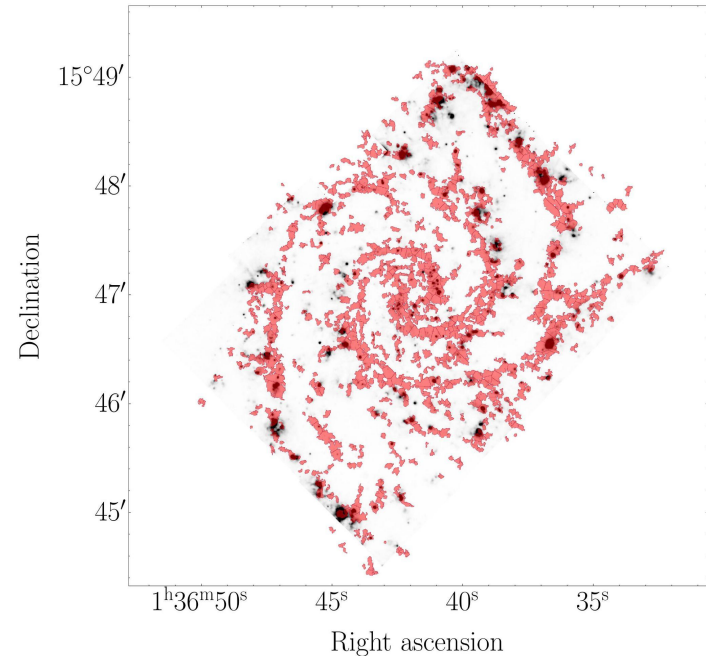

Molecular clouds:

- Cloud catalogue from PHANGS-ALMA survey
- **11 000** molecular clouds
- Observed in 12CO(2-1)
- 19 nearby galaxies

Rosolowsky et al. (2021)

Leroy et al. (2022)

Properties of interest:

Properties of interest:

- **H α luminosity**: Luminosity of an HII region in H α

Properties of interest:

- **H α luminosity**: Luminosity of an HII region in H α
- **T_{peak}**: Maximum CO brightness temperature of the cloud

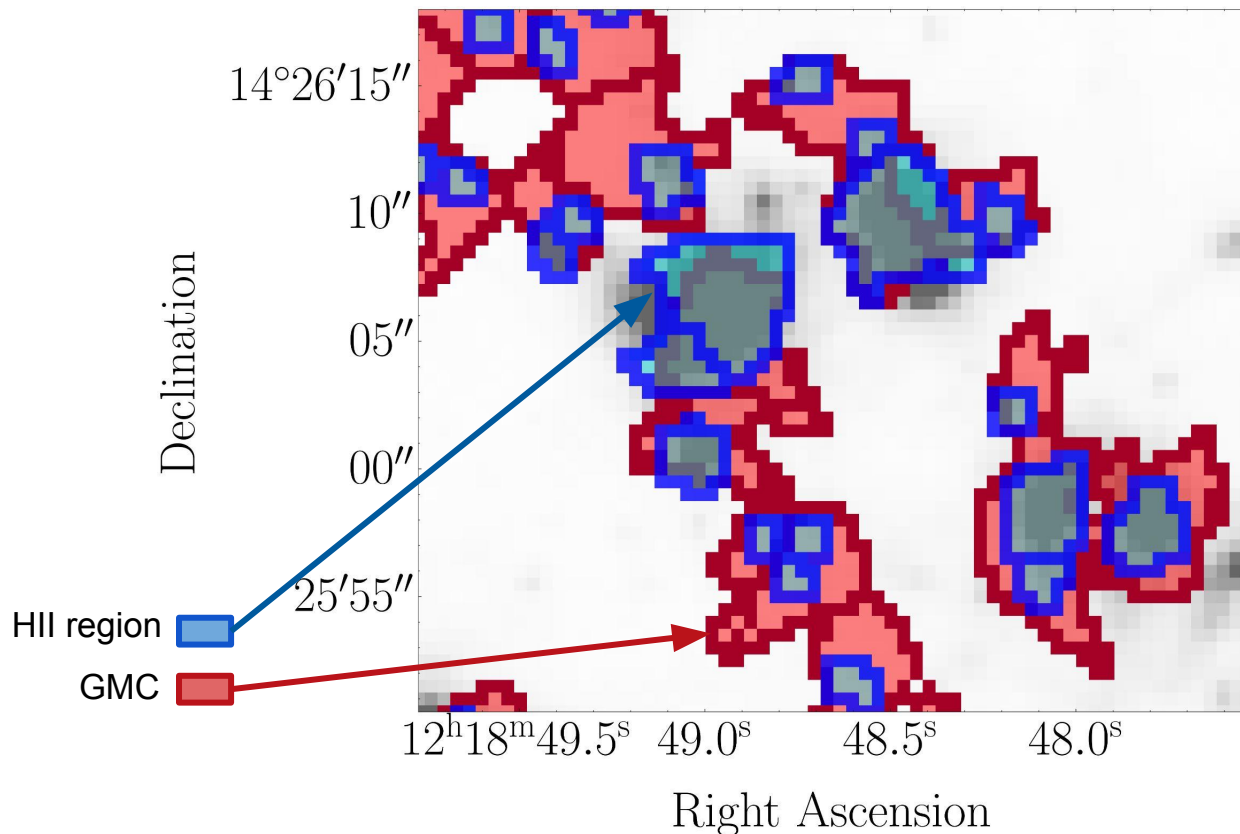

Properties of interest:

- **H α luminosity**: Luminosity of an HII region in H α
- **T_{peak}**: Maximum CO brightness temperature of the cloud
- **$\sigma_0 = \sigma_v / \sqrt{\text{Radius}}$** : Cloud normalized velocity dispersion

Need to associate HII regions and Clouds to perform our analysis

Need to associate HII regions and Clouds to perform our analysis

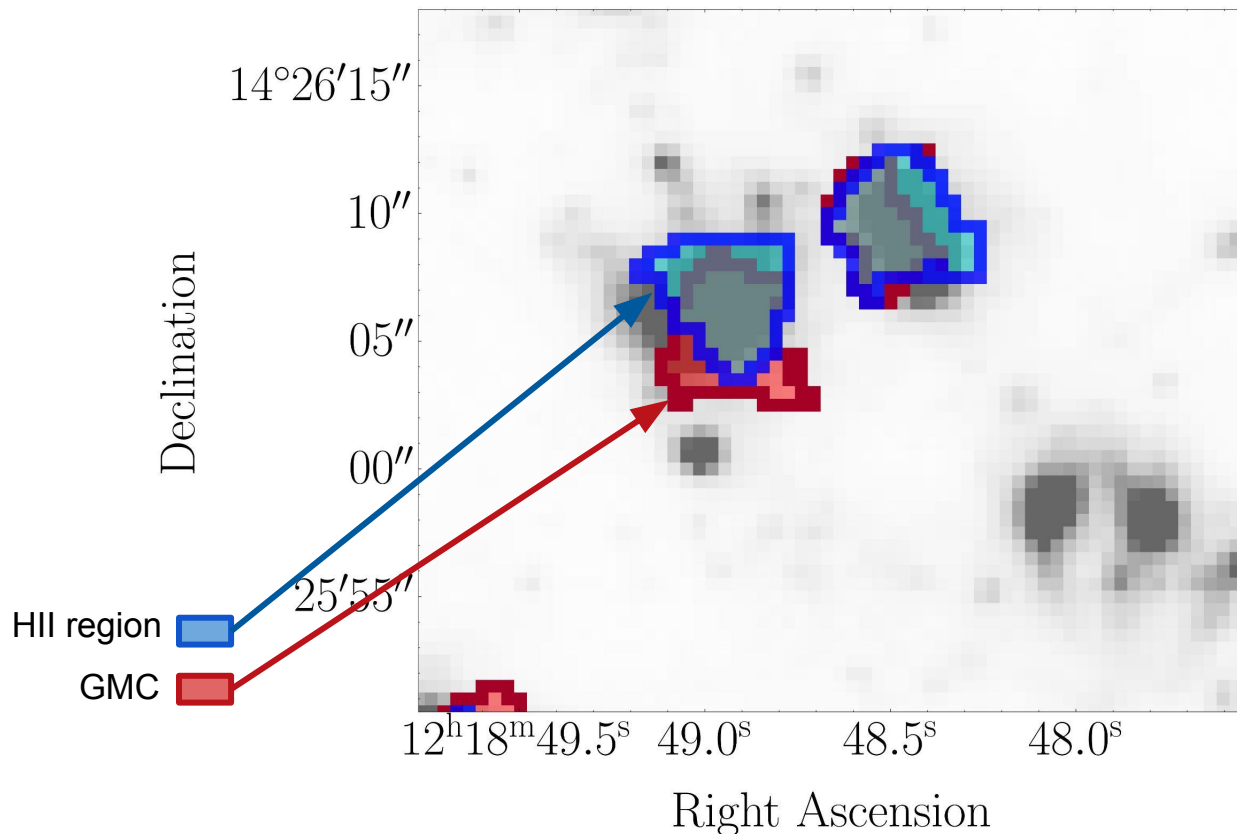

→ **Matching** method based on **2D spatial overlap** of **clouds** and **HII regions**

Matching parameter :
 Overlap percentage
 =
 overlap area / GMC area

Symmetry :
 Several HII region
 per GMC
 &
 1 GMC per HII region

Minimal Overlap Percentage =
10%

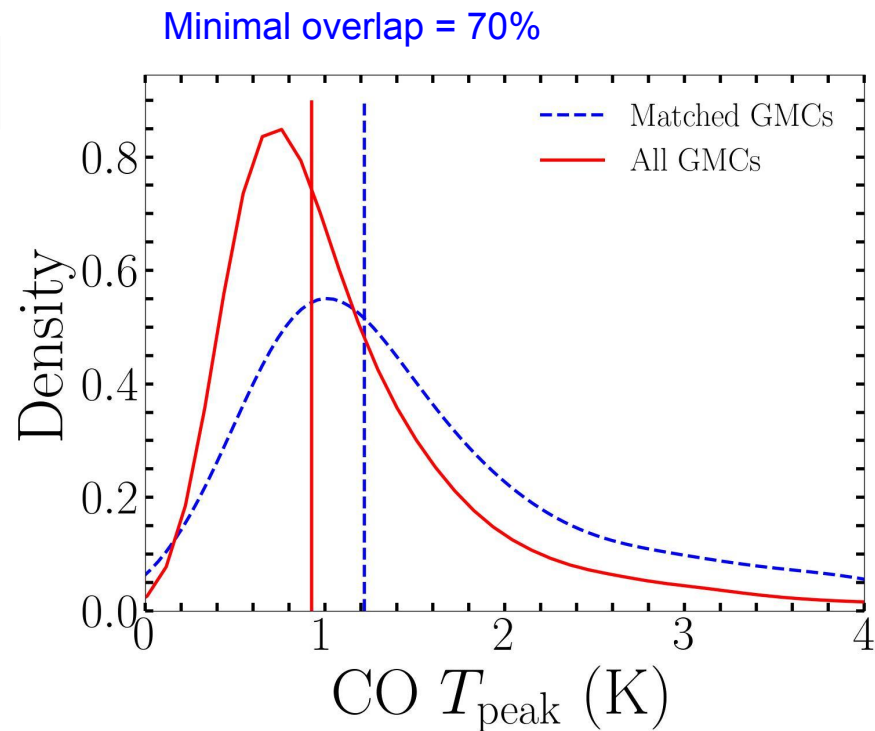

Matching parameter :
Overlap percentage
=
overlap area / GMC area

Symmetry :
Several HII region
per GMC
&
1 GMC per HII region

**Minimal Overlap Percentage =
50%**

1. Clouds peak temperature:

1. Clouds peak temperature:

→ **Matched clouds** have median **peak temperature higher** than global sample

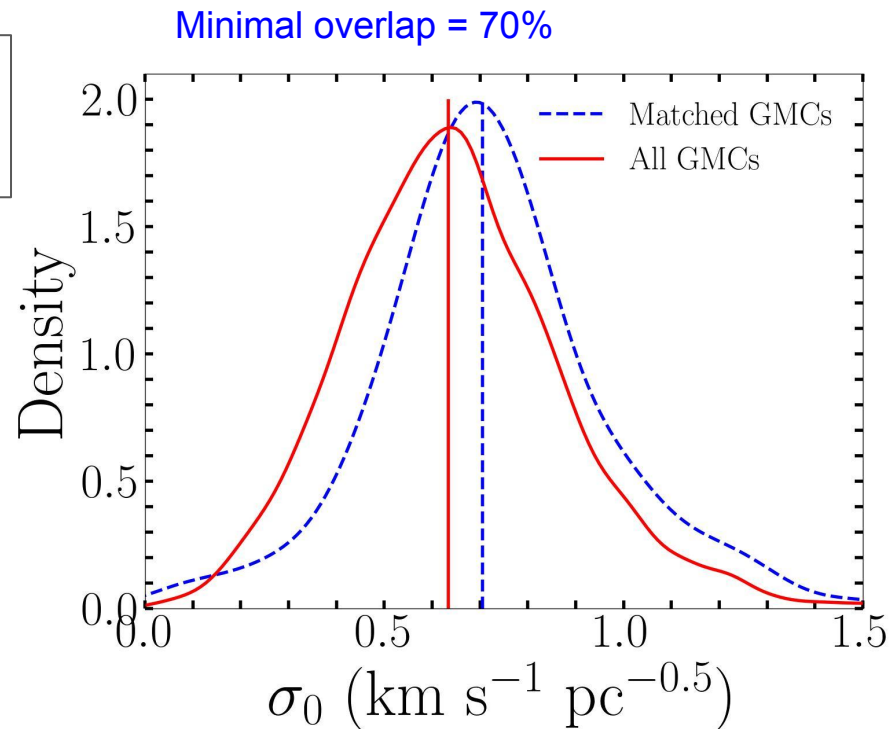

1. Clouds peak temperature:

→ **Matched clouds** have median **peak temperature higher** than global sample

→ Shift increases with overlap

1. Clouds normalized velocity dispersion (σ_0):

1. Clouds normalized velocity dispersion (σ_0):

→ **Matched clouds** have median σ_0 **higher** than global sample

1. Clouds normalized velocity dispersion (σ_0):

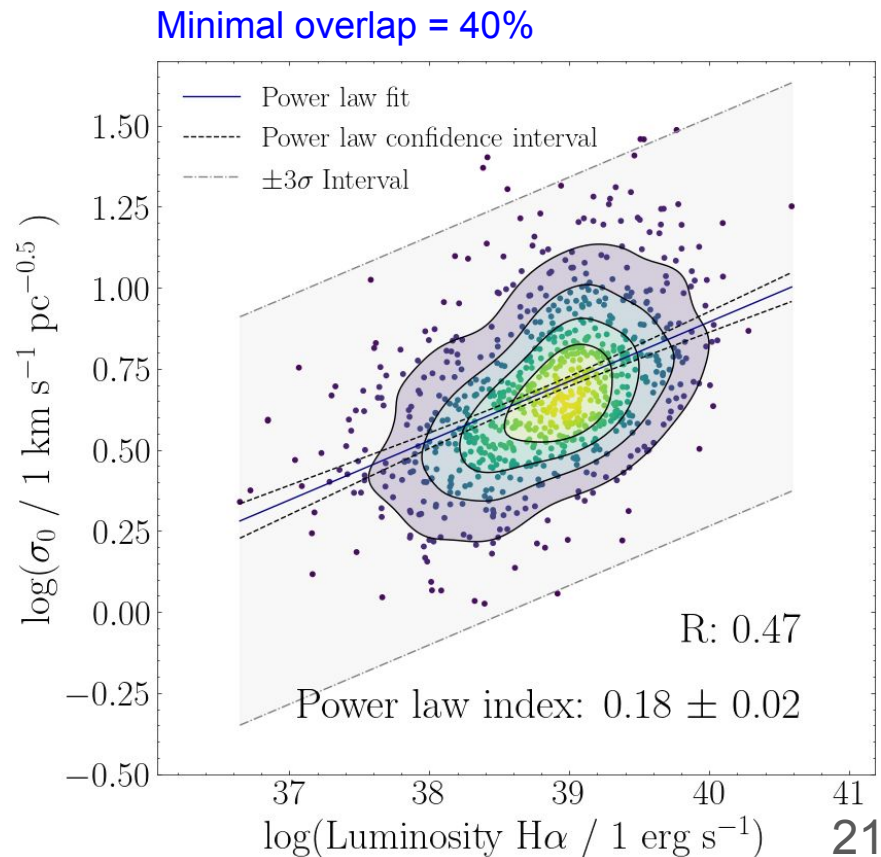

→ **Matched clouds** have median σ_0 **higher** than global sample

→ Shift increases with overlap

2. Normalized velocity σ_0 and H α luminosity correlation:

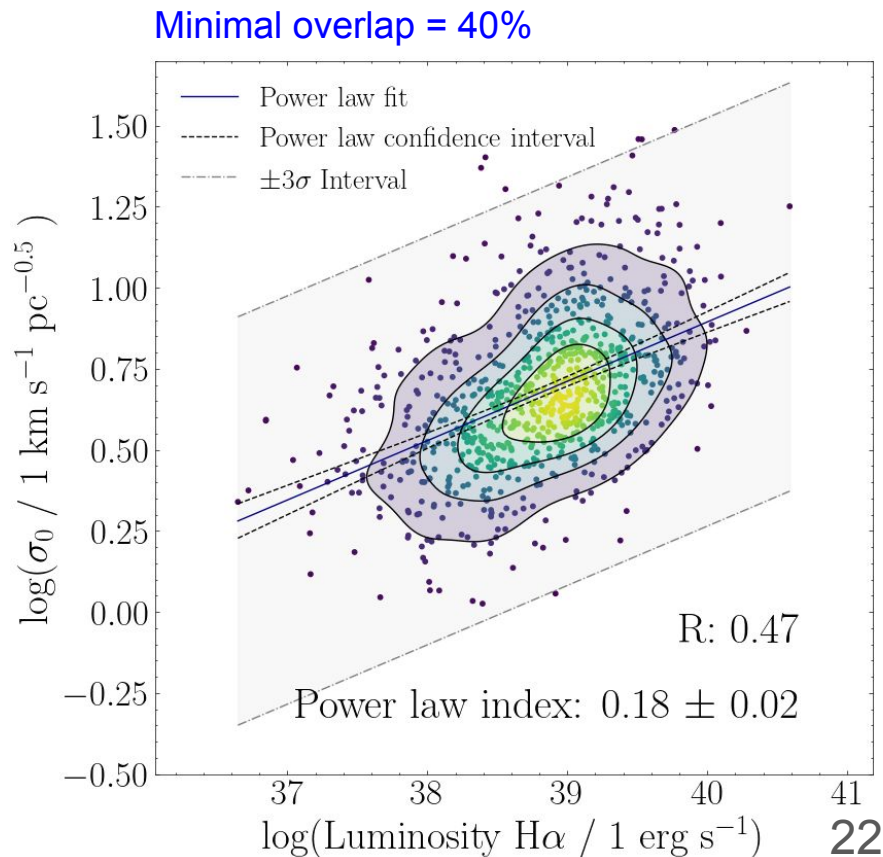

All matched clouds and HII regions from all 19 galaxies

2. Normalized velocity σ_0 and H α luminosity correlation:

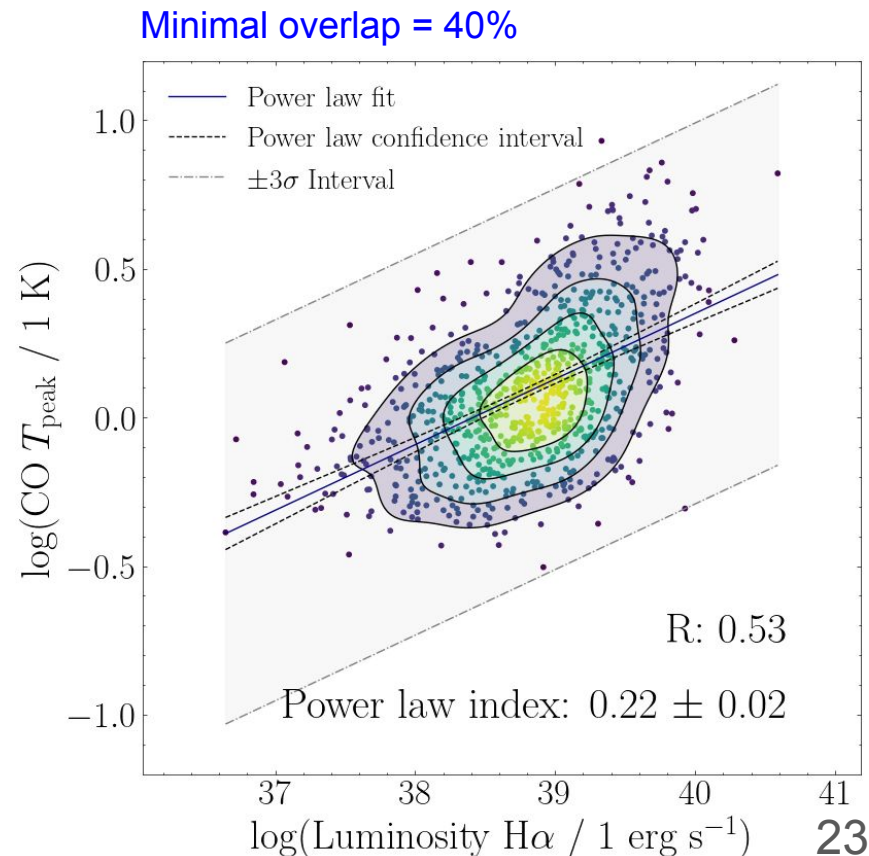

All matched clouds and HII regions from all 19 galaxies

→ **R = 0.47**: Significant correlation

2. Peak temperature and H α luminosity correlation:

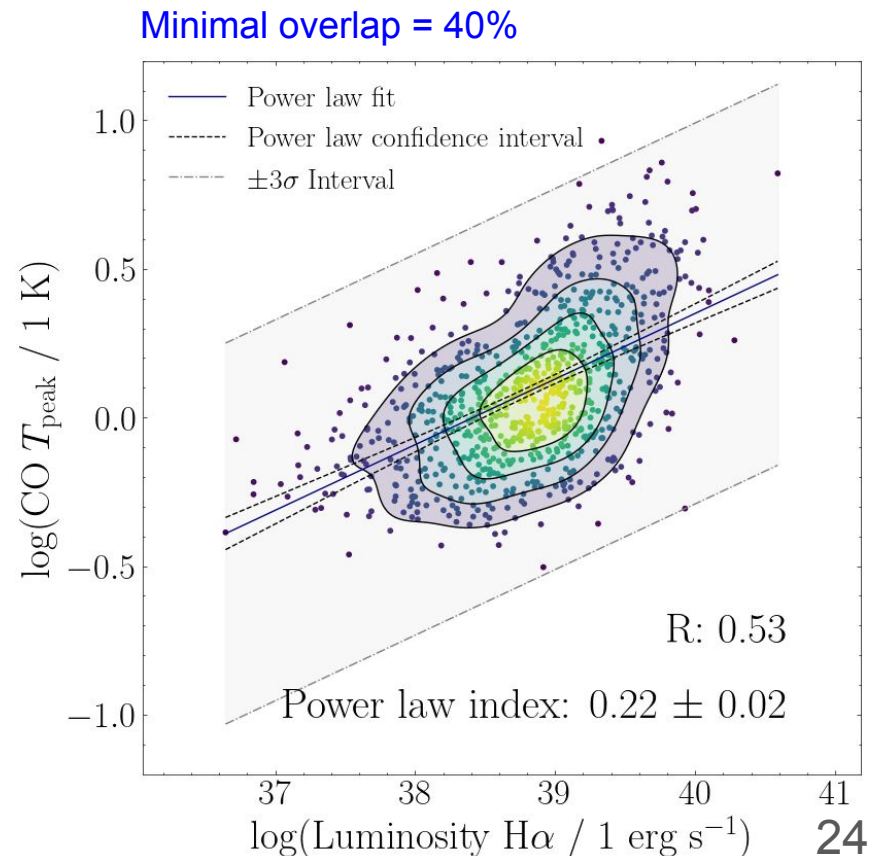

All matched clouds and HII regions from all 19 galaxies

2. Peak temperature and H α luminosity correlation:

All matched clouds and HII regions from all 19 galaxies

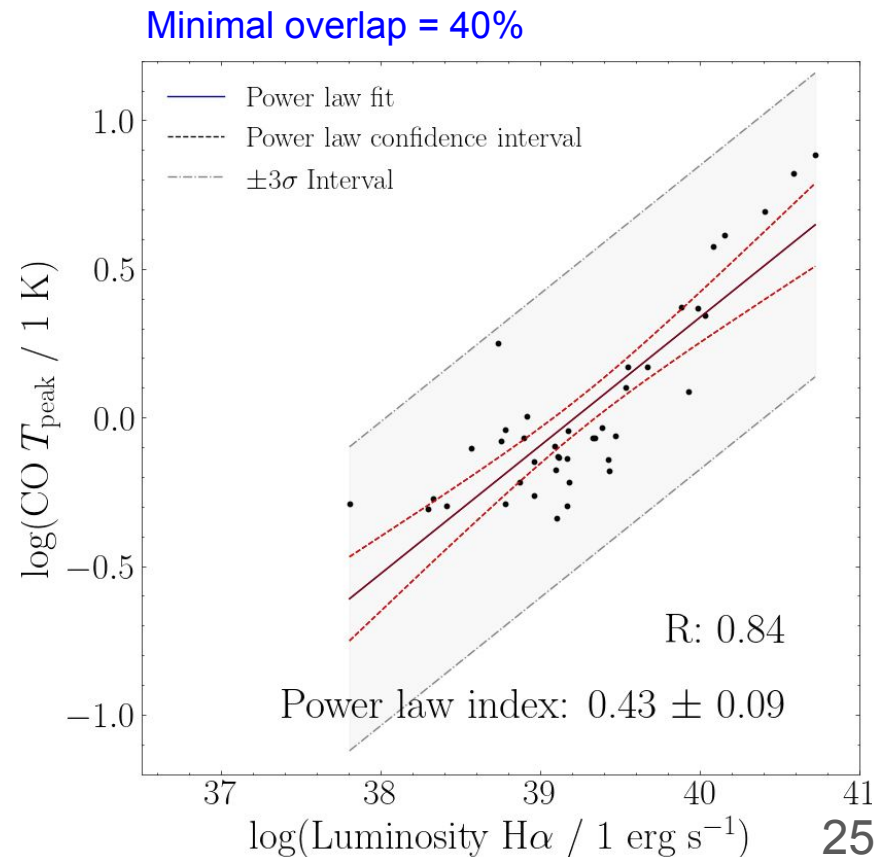

→ **R = 0.53**: Significant correlation

3. Correlations changes with galaxy

→ **Strong** correlation (**R = 0.84**)

in **NGC1672**

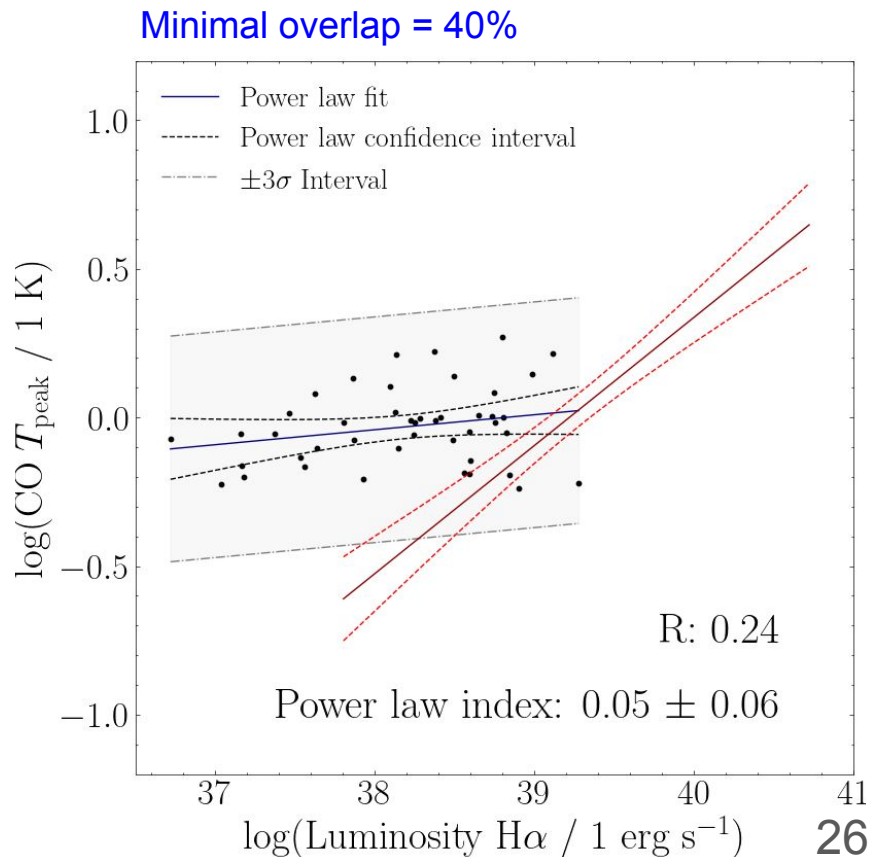

3. Correlations changes with galaxy

→ **Strong** correlation (**R = 0.84**)

in **NGC1672**

→ **Negligeable** correlation (**R = 0.24**)

in **NGC1433**

Conclusion

Conclusion

- **Clouds associated with an HII region have on average a higher peak brightness temperature and normalized velocity dispersion**

Conclusion

- Clouds associated with an HII region have on average a higher peak brightness temperature and normalized velocity dispersion
- **There is a correlation of HII region luminosity with cloud peak temperature and with cloud normalized velocity dispersion**

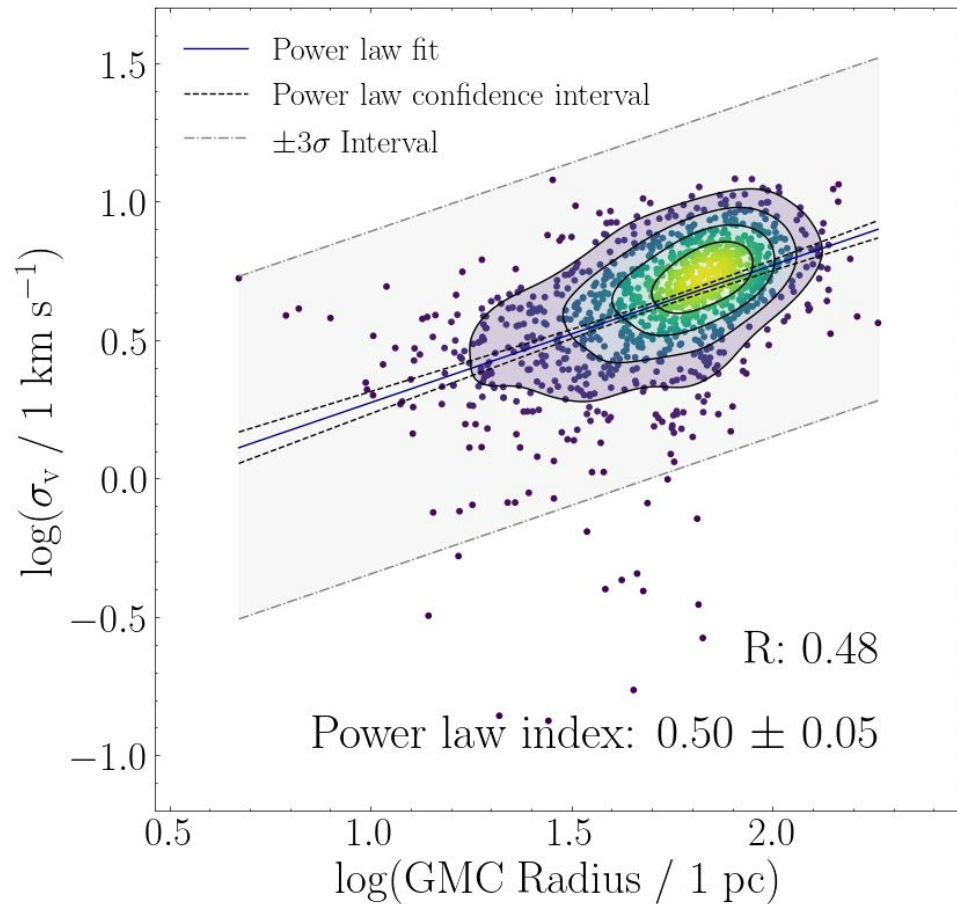

Conclusion

- Clouds associated with an HII region have on average a higher peak brightness temperature and normalized velocity dispersion
- There is a correlation of HII region luminosity with cloud peak temperature and with cloud normalized velocity dispersion
- **There is a large variability of the correlations galaxy by galaxy**

Annexes

Larson law:

- $\sigma_v \propto \sqrt{\text{Radius}}$

3. Correlations changes with galaxy

→ **Larger variability** galaxy by galaxy than by environment

→ **Main driver** is the galaxy's **total CO luminosity**

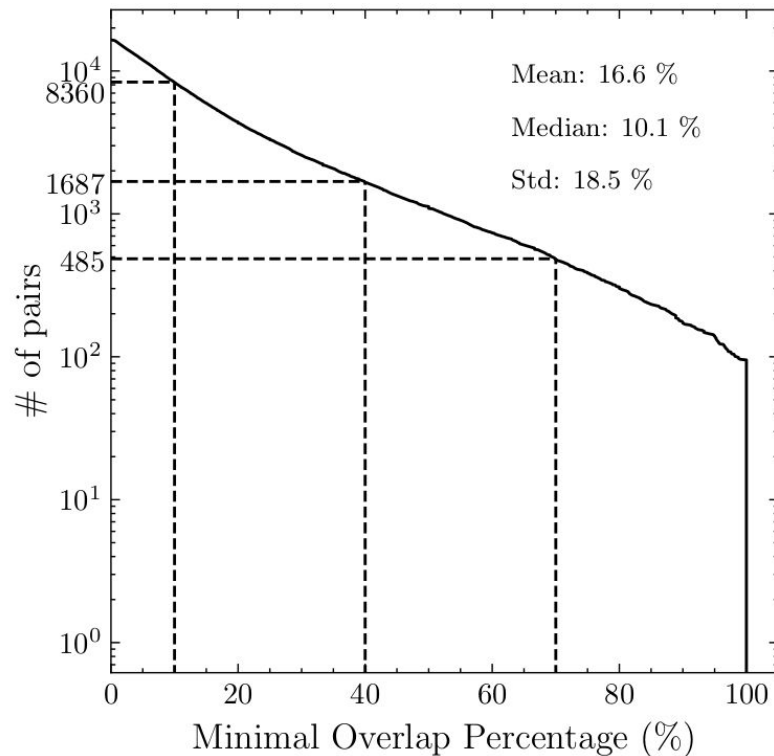

Minimal overlap = 40%
